For the indicators that FHOP has analyzed, rates reported are based on 3-year averages. Three-year averages allow for more uniform assessment of both small and large jurisdictions and result in narrower confidence intervals with a greater accuracy in assessing differences when comparing rates.</p> | | | | | | | | | | | | | | | | | | | | | |

The confidence interval is the range in which we are 95% certain the true rate falls. Cautions should be used in interpreting rates with very large confidence intervals.</p> <p>For some indicators, due to county level rates being unstable for many counties, regional data are reported instead of county level data. The + symbols appears next to rates that are regional rates.</p> |
